DV Internet Download Manager — User Guide

Version 0.5.27 · Windows 10/11

DV Internet Download Manager (DVIDM) is a desktop download manager with segmented downloads, download lists, scheduling, clipboard/Chrome import, a custom completion notification, and a dark/light interface.

---

1. Installation

1. Extract `DVIDM-Setup.zip`.
2. Run `DVIDM-Setup.msi` and follow the wizard.
   - Installs per user in `%LOCALAPPDATA%\Programs\DVIDM` (no administrator rights needed).
   - Adds Desktop and Start Menu shortcuts.
   - Can be uninstalled from **Settings → Apps → Installed apps**.
   - The installer is unsigned, so Windows SmartScreen may warn.
3. Start DVIDM from the shortcut.

Installing the browser extension

The extension is **not installed automatically** (Chrome no longer allows silent unpacked extension installs). Install it once manually:

1. Open `chrome://extensions` (or `edge://extensions` in Edge).
2. Turn on **Developer mode** (top right).
3. Click **Load unpacked**.
4. Select the `chrome-extension` folder from:
   - the extracted `DVIDM-Setup` folder, or
   - `%LOCALAPPDATA%\Programs\DVIDM\chrome-extension`.
5. Pin DVIDM from the extensions (puzzle) menu.

After updating DVIDM, click **Reload** on the extension card if needed.

---

2. Adding downloads

From the URL bar

Paste an `http(s)` link into the URL field and press **Download** (or Enter).

From the clipboard

Click **Clipboard**. If the clipboard contains several links, a review window opens; choose the links, a destination list, and press **Add**.

From Chrome/Edge

The extension sends links to DVIDM over a local connection (`127.0.0.1:52137`); DVIDM must be running. A review window titled **From Chrome** opens, where you can uncheck links, choose a list, and press **Add**.

Extension controls:

- **Send selected links on page** and **Copy selected links** in the popup.
- Right-click menus: **Download link with DVIDM**, **Send selected links to DVIDM**, **Copy selected links**, **Send this page to DVIDM**.

Don't start immediately

The **Don't start immediately** toggle (toolbar and review windows) adds new downloads paused. Use **Start / Start list** to begin them later. List limits never start these automatically.

---

3. The main window

Toolbar

- **Start list / Pause list / Delete all from list** act on the current view when nothing is selected; with rows selected they become **Start / Pause / Delete** and act on the selection.
- ↑ **/** ↓ move selected rows up/down the queue (sorting must be off).
- **List** adds selected rows to a download list.
- **Search downloads...** filters by file name.

Download table

Columns: number, Status, Lists, File name, Size, Progress, Speed, ETA, Parts, Last date, Actions.

- Click any sortable header to sort; click again to reverse; a third click clears the sort. The sort state is saved for the next launch.
- **Last date** shows the completion date; older completed rows fall back to their added date.
- Select rows with the checkboxes. You can press on a checkbox and **drag down** to select/deselect several rows.

Row actions

- **Folder/file button** — opens the finished file, or the folder while the download is incomplete. Right-click opens the folder.
- **Play/Pause button** — starts or pauses the download.
- **Yellow circular arrow** (completed rows) — download the file again; a warning lets you choose **Keep the old file** (a second copy is saved) or replace the old file.
- **List button** — add the row to a list.
- **Delete button** — remove the row (confirmation dialog).

File Properties

Right-click a row to open **File Properties**: type, status, size, save path, address, downloaded amount, progress and lists.

- **Address** can be edited only while the download is paused. Progress is kept, so use a mirror or refreshed link of the same file.
- **Open** opens the file or folder; **OK** closes.

---

4. Download lists

The sidebar contains Library categories and Download Lists. The sidebar can be widened/narrowed by dragging the divider (220–420 px); the width is saved.

Each list shows:

- a coloured list icon,
- a play indicator when one of its unfinished downloads is active,
- a pause indicator when nothing is running (amber when everything unfinished is paused, dim when the list is empty/finished),
- a dim clock, which turns amber when a schedule is active,
- its unfinished-download count,
- options (⋯) and delete (trash) buttons.

List options

Click ⋯ or right-click a list:

- Rename, colour, maximum parallel downloads.
- Optional time window (start/end) and "shut down when the window ends".
- **Save list…** — writes the list's unfinished URLs to a `.txt` file.
- **Load list…** — choose one or more `.txt` files and add their links through the same review window used by clipboard import.

Delete a list with the trash button; a confirmation appears. **Shift-click** skips the confirmation. Downloads are not deleted.

---

5. Settings

Open **Settings** at the bottom of the sidebar (the same button reads **Close settings** while open).

- **Appearance** — light/dark theme.
- **Startup** — **Start DVIDM with Windows** (per-user startup entry).
- **Notifications** — enable/disable the completion notification.
- **Save to** — destination folder for new downloads (default: Windows Downloads).
- **Temporary files** — folder for partial files (default: `%TEMP%\DVIDM`). Changing it moves partial files for paused downloads; pause active downloads first.
- **Connections** — parallel parts per file (1–32).
- **Speed limit** — Unlimited, presets, or a custom KB/s value.
- **Retry** — re-download failed parts and the wait between attempts.
- **Interface font** — choose an installed font.

If a saved download or temp folder is unavailable on this PC (for example a `G:\...` path on a machine without a G: drive), DVIDM automatically falls back to this PC's Windows Downloads folder / `%TEMP%\DVIDM` and saves that choice.

---

6. Notifications

When a download finishes, a dark card appears in the bottom-right corner of the monitor (not a standard Windows notification): green check, "Download complete", and the file name.

- It closes after 5 seconds; click it to close immediately.
- Turn it off under **Settings** → **Notifications**.

---

7. Tray and background

- Closing the window hides DVIDM to the notification area; downloads keep running.
- Left-click the tray icon to reopen the window.
- Right-click the tray icon for **Open** and **Exit**.
- Only one DVIDM instance can run at a time.

---

8. Status bar

Shows the number of files, active downloads, connections, current limit, total speed, and free space on the destination drive.

Icons on the right:

- **Logs** — open the debug log window.
- **App folder** — open the folder containing `DVIDM.exe`.

---

9. Files and data

Settings and history live next to the executable:

File	Purpose
`settings.json`	Preferences, lists, sort state
`catalog.json`	Download rows and progress state
`DVIDM-debug.log`	Temporary diagnostic log

Default folders:

- Finished downloads: Windows Downloads (fallback: `<app>\downloads`).
- Partial files: `%TEMP%\DVIDM` (fallback: `<app>\temp`).

For an installed copy these files are in `%LOCALAPPDATA%\Programs\DVIDM`.

10. Debug log

Click the **Logs** icon in the status bar. The log opens in its own window with selectable text, plus **Refresh**, **Copy all**, **Open file**, and **Close**. It records commands, download state changes/errors, window visibility, and panics — useful when reporting a problem. Send the log file or **Copy all** output.

11. Troubleshooting

Problem	What to try
Extension shows **Offline**	Start DVIDM; make sure port 52137 is free.
Extension sends nothing	Reload the extension in `chrome://extensions`; keep DVIDM running.
Download shows **Failed**	Open File Properties to see the stored error; check the URL, disk space and destination permissions.
Open/folder does nothing	Verify the folder still exists; move the download entry or use File Properties.
Downloads start when they shouldn't	Turn on **Don't start immediately** before adding; queued rows never auto-start from a list cap.
Completion card missing	Enable **Settings** → **Notifications**; check Windows notifications are enabled.
Wrong paths after moving to another PC	DVIDM resets unavailable download/temp folders to Windows defaults automatically.
App won't open	It may already be running in the tray (single instance).

Uninstalling

Use **Settings** → **Apps** → **Installed apps** → **DV Internet Download Manager**. Uninstalling removes the program files. Downloads, `settings.json` and `catalog.json` may remain in `%LOCALAPPDATA%\Programs\DVIDM`; delete that folder manually if you also want to remove user data.
